

ScoringAg Polyester UV Covers
used in high tunnels or hoop houses to stop
Spotted Wing Drosophila (SWD) also called Suzuki fly

Capital investment to establish **one acre of raspberries under tunnels were paid off in the second year and annual net profit after the first year was estimated to be about \$12,000.** The primary drawback to organic raspberry production under tunnels at this point is the challenge to manage Spotted Wing Drosophila (SWD) with organic-approved practices. We do not have a means of consistently controlling this pest. Recent research shows exclusion netting can be used to minimize access of SWD to tunnel plants with foyer type 2-door entrance end of screen houses
